

22nd Annual Symposium  
Clinical & Pharmaceutical Solutions through Analysis

# Microsampling & Patient Centric Sampling

A journey through what it is and  
how you can incorporate it into  
your workflows

*Monday 28<sup>th</sup> October 2019, 12:00-16:00 University Grille*

## Short Course Outline

- 12:00 Lunch, Welcome & Introductions  
*Neil Spooner & Joe Siple*
- 12:30 Introduction to Microsampling  
*Presentation - Neil Spooner*
- 13:00 Considerations for drug bioanalytical assay method development & validation, and clinical implementation strategies  
*Presentation & Discussion - Tim Olah & Enaksha R Wickremsinhe*
- 14:00 Break
- 14:15 Considerations for Clinical Operations  
*Presentation & Discussion - Melanie Anderson*
- 15:15 Future Directions  
*Discussion - Kevin Bateman & Neil Spooner*
- 15:45 Wrap-up & next steps
- 16:00 End

# Introduction to Microsampling

**Neil Spooner** PhD, CChem, FRSC ([neil@spoonerbioanalytical.co.uk](mailto:neil@spoonerbioanalytical.co.uk))

Founder & Director - Spooner Bioanalytical Solutions Ltd, UK

Senior Visiting Research Fellow - School of Life & Medical Sciences, University of Hertfordshire, UK

Senior Editor – Bioanalysis Journal

There is growing interest in the implementation of microsampling approaches for the quantitation of circulating concentrations of analytes in biological samples derived from nonclinical and clinical studies involved in drug development. This interest is partly due to the ethical advantages of taking smaller blood volumes, particularly for studies in rodents, children and the critically ill. In addition, these technologies facilitate sampling to be performed in previously intractable locations and occasions. Further, they enable the collection of samples for additional purposes (extra time points, biomarkers, sampling during a clinical event, etc). This article gives a comprehensive insight to the utilization of these approaches in drug discovery and development, and provides recommendations for best practice for nonclinical, clinical and bioanalytical aspects.

First draft submitted: 26 February 2019; Accepted for publication: 30 April 2019; Published online: 20 June 2019

# What is microsampling?

Conventional Volumes  
(200  $\mu$ L – ? mL)

Micro-volumes  
( $\leq$  100  $\mu$ L)

Technologies for collecting & analysing smaller blood & plasma / serum volumes for the accurate determination of circulating concentrations of therapeutic drugs, metabolites & biomarkers in non-clinical & clinical studies

Spooner *et al* (2019) *Bioanalysis* **11(10)** 1015–1038

# Non-Clinical – Why do this?

## Ethical - 3Rs

- Reduction in rodent animal numbers
  - Elimination of TK satellites reduces number of animals by 30-40%
    - Effects primarily on reticulocytes; no affect in overt toxicity assessment, e.g., hepatotoxicity, renal toxicity\*
  - Serial TK & PK sampling in mice
  - Discovery PK/PD, mouse TK & PK/PD & juvenile studies
- Refinement of bleeding technique
  - Reduction, or elimination of rodent warming
  - Sampling from more convenient / less disruptive location

\*Powles-Glover *et al* (2014) *Reg. Toxicol. Pharmacol.* **68**, 325-331

# Non-Clinical – Why do this, cont'd?

## Improved data quality

- Exposure data in main study animals, rather than additional satellites
- Direct correlation of exposure with PD and toxicological outcomes

## Enables samples to be taken for other purposes

- Additional PK/TK timepoints, biomarkers, metabolites, Clin. Path. determinations, etc.

## Cost

- Reduced animal numbers, housing, drug substance
  - .....but, consumable costs are higher

See <https://nc3rs.org.uk/microsampling>

However, this course is **NOT** simply about microsampling...

.....But it **IS** about moving beyond conventional clinical blood sampling

# It's about collecting.....

- ...the appropriate sample...
- ...in a location that is most convenient for the patient...
- ...that provides high quality information

This may be blood sample volumes of 10  $\mu$ L, or it may be 250  $\mu$ L

With the **PATIENT** at the centre of our considerations

## Patient Centric Sampling

# Benefits of Patient Centric Blood Sampling

## Quality

Obtaining a high quality blood / plasma / serum sample for accurate quantitative determination of drugs, drug metabolites & endogenous molecules

## Patient

Minimising the impact on the human patient / consumer

- Optimising blood volume sampled
- Minimising pain
- Facilitating convenience

## New Data

Generating concentration data in situations that are currently difficult, or impossible to work with

# Dried Blood Spots

Established for neonatal screening for 50+ years

Delivers all the benefits outlined

## PLUS - Simpler process

- Removes need for centrifugation or sub-aliquots
- Dry ice and freezers not required
  - BIG cost savings on sample shipments

Barfield *et al* (2008) *J. Chrom. B* **870**, 32-37; Spooner *et al* (2009) *Anal. Chem.* **81**, 1557-1563; Spooner *et al* (2010) *Bioanalysis* **2(8)** 1515-1522; Pandya *et al* (2011) *Bioanalysis* **3(7)** 779-786; Stokes *et al* (2011) *Lab. Animals* **45**, 109-113;

# However!!!

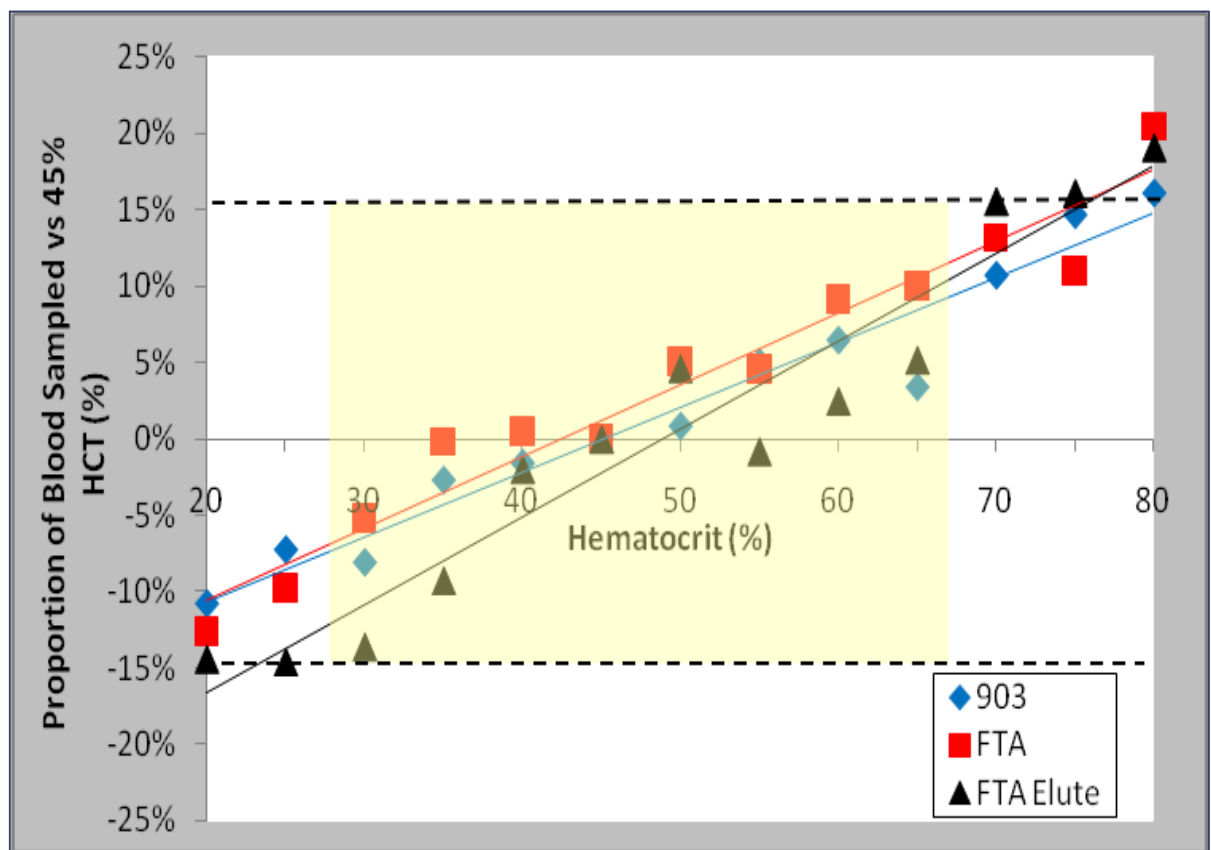

Blood hematocrit affects the size of the derived blood spot

# Leading to a bias in the quantitative data!

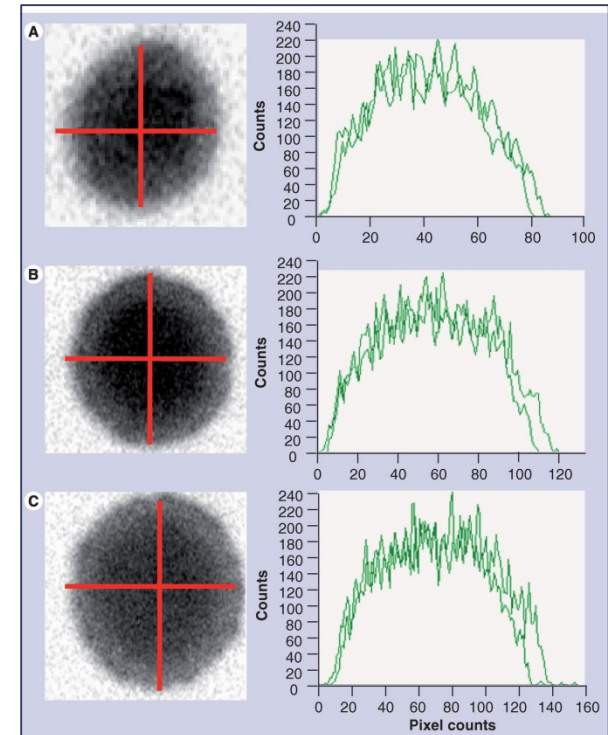

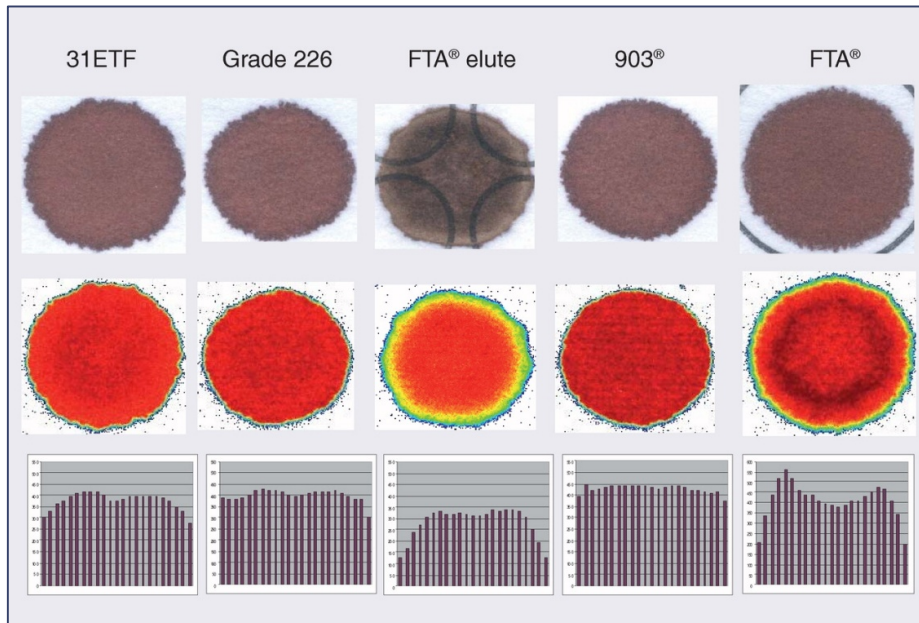

Fixed diameter disc collected from spot with varying HCT

- All data normalized to 45% HCT

Denniff & Spooner (2010)  
*Bioanalysis* 2(8) 1385-1395

# Spot homogeneity

Example radio histograms of the (A) 15-, (B) 30- and (C) 45-µl blood spots spiked with <sup>14</sup>C radiolabeled UK-414495

Ren *et al*, (2010) *Bioanalysis* **2**(8) 1469-1475; Clark *et al* (2010) *Bioanalysis* **2**(8) 1477-1488

# Resulting in.....

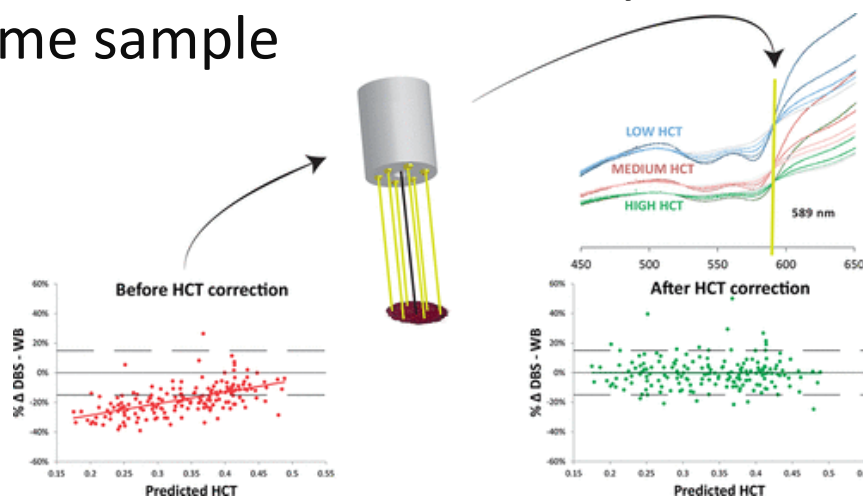

Regulators (FDA & EMA) required collection & analysis of both wet and dry samples and demonstration of concordance in healthy volunteers and patient groups

Denniff & Spooner (2010) *Bioanalysis* **2(8)** 1385-1395; O'Mara *et al* (2011) *Bioanalysis* **3(20)** 2335-2347; de Vries *et al* (2013) *Bioanalysis* **5(17)** 2147-2160; Cobb *et al* (2013) *Bioanalysis* **5(17)** 2161-2169; Evans *et al* (2015) *AAPS J.* **17(2)** 292-300; Kothare *et al* (2016) *AAPS J.* **18(2)** 519-527

# Ways forward for DBS sampling

- Closely match HCT of analytical calibrants & QC's to that of the clinical study samples
- Normalise data to another readily measured component of the same sample

- Collect accurate sample volume & analyse entire sample

Capiou *et al* (2018) *Anal. Chem.* **90**(3) 1795-1804; Velghe *et al* (2019) *J. Pharm. Biomed. Anal.* **163**, 188–196

# Collect accurate sample volume & analyse entire sample

## For quantitative analysis

- Technologies required that overcome the issues associated with
  - Blood hematocrit
  - Sample homogeneity
- Whilst delivering the benefits
  - Collecting smaller blood volumes (where appropriate)
  - Facilitating self/assisted sampling
  - Delivering cost savings through home sampling & room temperature sample shipments
  - Integrating with systems for sample shipping, tracking & analysis

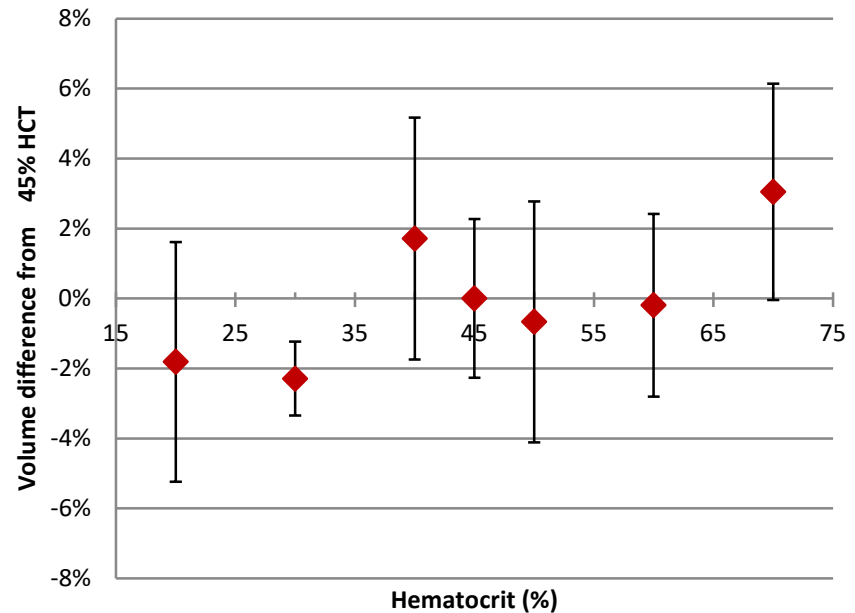

# A number of novel approaches are now commercially available

# HCT independent volumetric sampling performance

- Human blood at different HCTs was spiked with  $^{14}\text{C}$  caffeine
- Tip oxidised to  $\text{CO}_2$

Denniff & Spooner (2014) *Anal. Chem.* **86**, 8489-8495, Denniff *et al* (2015) *J. Pharm. Biomed. Anal.* **108**, 61-69, Spooner *et al* (2015) *Bioanalysis* **7(6)** 653-659

# This is **NOT JUST** about collecting the samples and data we do today!

Pediatrics

Critically ill

Remote areas

Additional data

- PK
- Biomarkers
- Compliance
- Therapeutic drug monitoring
- Medical event – migraine
- Longitudinal

Convenience

Improved clinical trial recruitment & retention

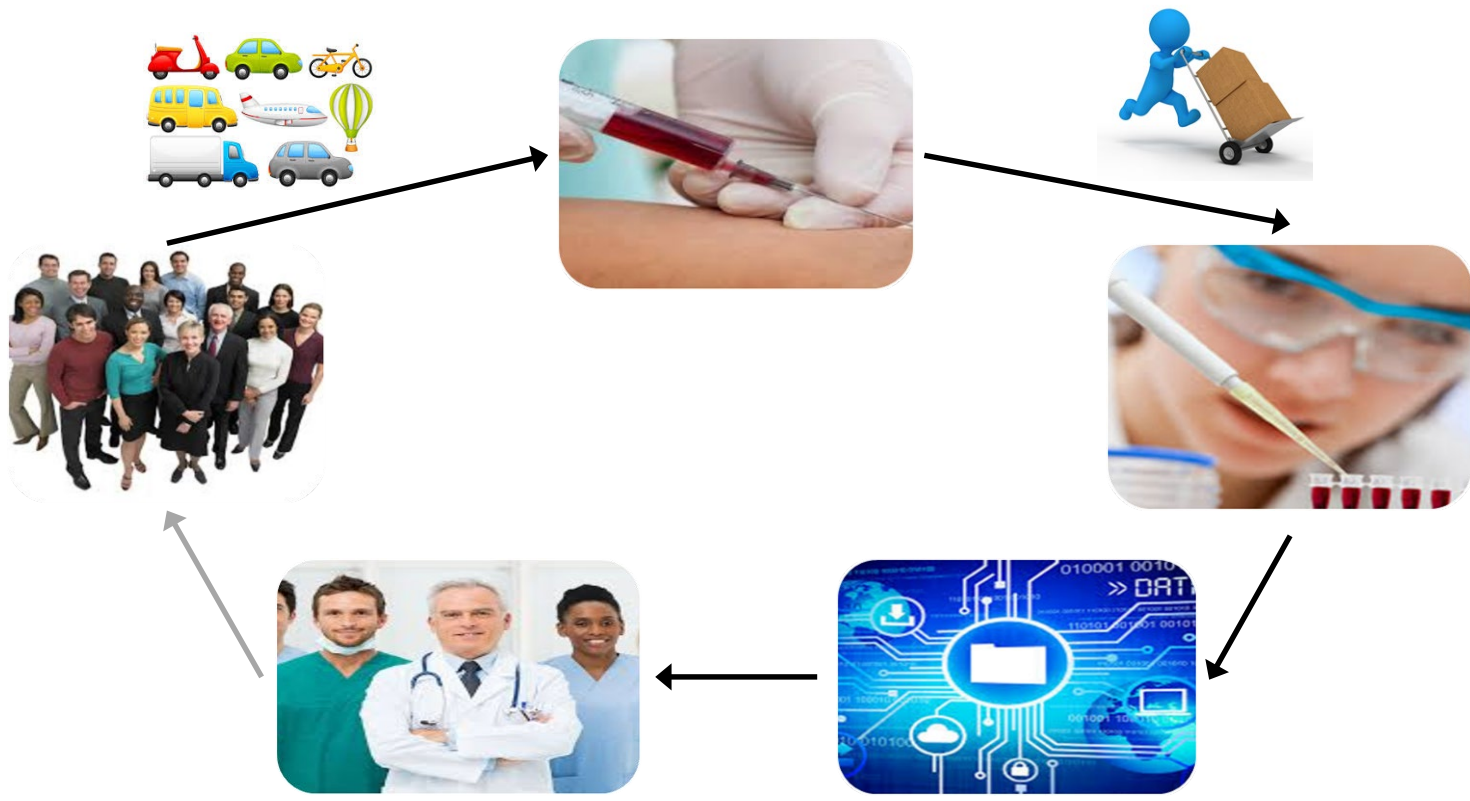

Patient / Consumer driven healthcare

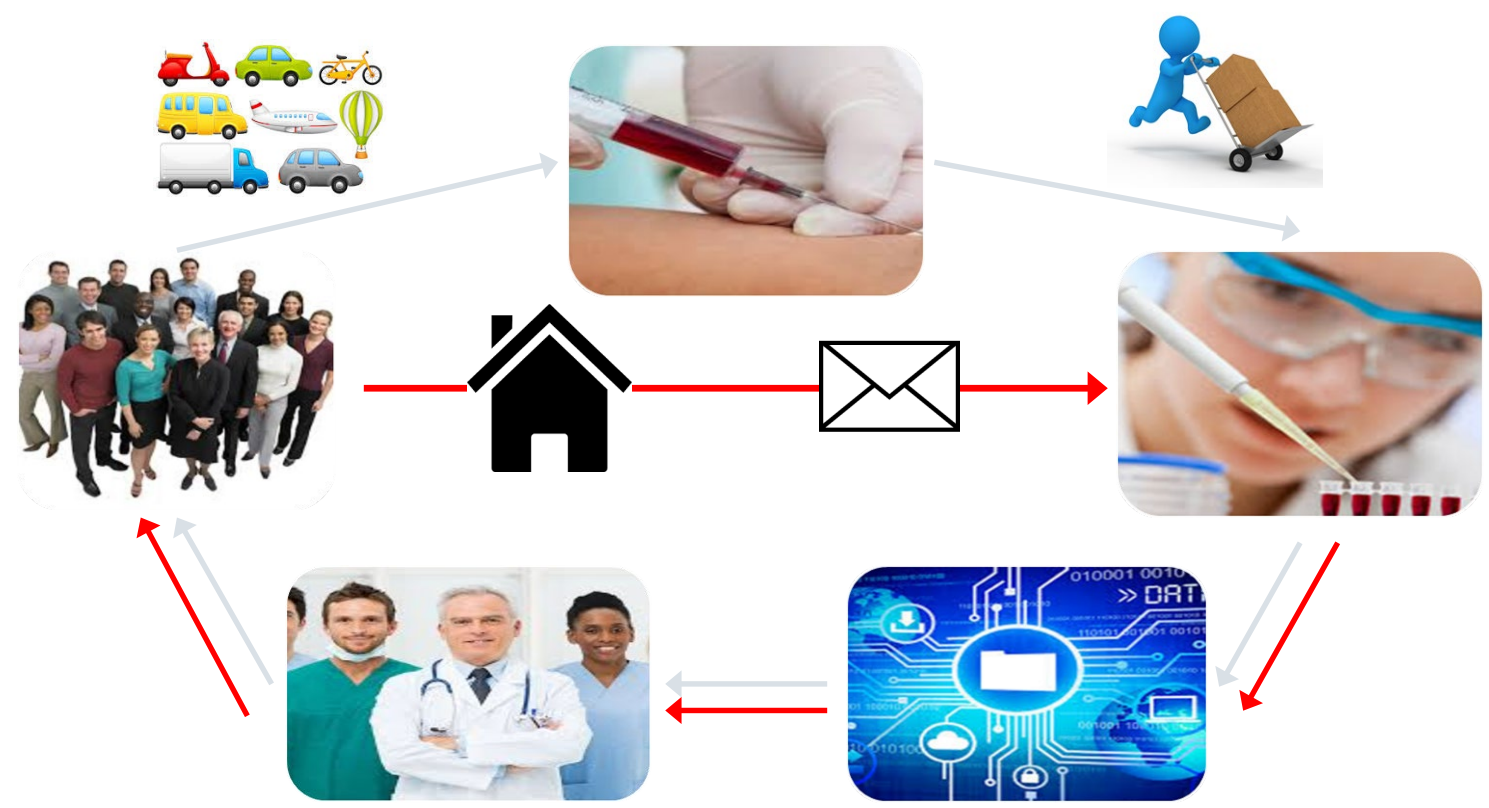

# Leading to a new way of working? Current

# Future?

More often, for more analytes....

# Is the future already here? Consumer-led healthcare

thrive

# Potential challenges.....

Is the sample representative of the whole?

Non-conventional sample format

- Sample transfer
- Storage
- Analysis
- Automation

Bridging to existing data

- Blood / Plasma
- Venous / Capillary
- Wet / Dry

Additional assay validation steps

Data acceptability

- Regulators

Reluctance to change!!!

# Regulatory Landscape

## Non-Clinical

- [ICH Q&A](#) on Microsampling as part of ICH S3A Guideline (Nov 2017)
- Also See
  - Beharry (2010) *Bioanalysis* **2(8)**, 1363–1364
  - Viswanathan (2012) *Bioanalysis* **4(12)**, 1417–1419

## Clinical

- FDA guidance provided in latest [BMV document](#) (May 2018)
- Draft [ICH M10](#) Guidance on BMV (Feb 2019)
- Also see
  - Evans, *et al* (2014) *The AAPS Journal* **17(2)**, 292-300
  - Kothare, *et al* (2016) *The AAPS Journal* **18(2)**, 519–527

**Further details on BMV will be given later in this course**

# Change is difficult!

---

It depends on how you look at it!

# Working together to get “stuff” done

---

# Patient Centric Sampling Interest Group

>90 members

>50 different organisations

- CROs, biotech, pharma, device innovators, instrument vendors, consumable vendors, consultancies, etc

Collaborate in non-competitive areas of interest

- Standardisation
  - Working with CLSI to build an industry standard
- Broad acceptance of patient centric sampling technologies and pathways to their implementation
  - Public, Scientific community, Medical community, Legislators, Payers, Regulators, Media, etc.....
  - Building external facing website

# Other Forums for working together

# Conclusions

New blood sampling & analytical technologies are emerging

Enables us to put the patient first & facilitates human wellbeing

Enables us to collect data that has previously been difficult / impossible to obtain

It's about so much more than the devices

Working across boundaries will enable the change to happen

Change will not be easy & there will be surprises

Clinical & Pharmaceutical Solutions through Analysis  
October 28-31, 2019  
Langhorne, PA

22nd Annual Symposium  
Clinical & Pharmaceutical Solutions through Analysis

**Microsampling Workshop**  
**Considerations for bioanalytical assay  
method development/validation and  
clinical implementation strategies for drug candidates**

Enaksha Wickremsinhe & Tim Olah

## Selecting a Microsampling technique

- **Multiple techniques:** enabling collection of reduced blood volumes
- **Stage of assay implementation:** Discovery or Development
- Discovery: minimal validation, fit for purpose
- Development: must meet BMV guidance (EMA 2011, FDA 2018, ICH M10, etc)
- What is different when compared to routine bioanalytical methods
  - **Dried** sample (blood or plasma) vs **wet** sample (blood or plasma)
  - **Sample volume:** capability to handle small samples/volumes
  - **Collection device/format:** selection, ease of use, cost
  - **Source** of blood: IV draw, finger-stick, subcutaneous

# Bioanalytical challenges for microsampling

- **Preparation of Standard Curves and QCs**
- **Assay sensitivity:** can you achieve the required LLOQ?
- **Additional validation experiments:** depends on technique employed
- **Account for stability during collection/transit/storage**
  - temperature, humidity, drying time, shipping conditions, etc.
- **Addition of Internal Standard:** in extraction solvent or on pre-dried device?
- **More time and effort required in BioAnalytical lab**
  - Samples are not in 96-well format, AUTOMATION not currently possible
- **Sample storage and related logistics:** physical change or analyte degradation
- **Overall BioAnalytical cost higher than current practices?**

## Other Bioanalytical challenges

which may require **unique** experiments or assessments

- Cost to perform cross validation
- Cost of “novel” devices needed for method dev and validation
- Impact of mismatched data sets (poor correlation?)
- Understanding assay efficiencies, operational errors?
- Impact of shipping, storage, and handling temperatures
- Assess homogeneity of samples (especially DBS)
- Multiple “aliquots” of microsamples

## Considerations for Clinical Implementation

1. In Vitro data: B:P ratio and  $F_u$  (protein binding) should not be conc dependent. No Hct effect over clinically relevant range
2. BioA feasibility: LLOQ, Stability, Hct, Homogeneity, etc.
3. Establishing concordance (Bridging): relationship between microsampling conc data and traditional sample (plasma/serum) concentrations data (such that PK conclusions can be drawn across studies)

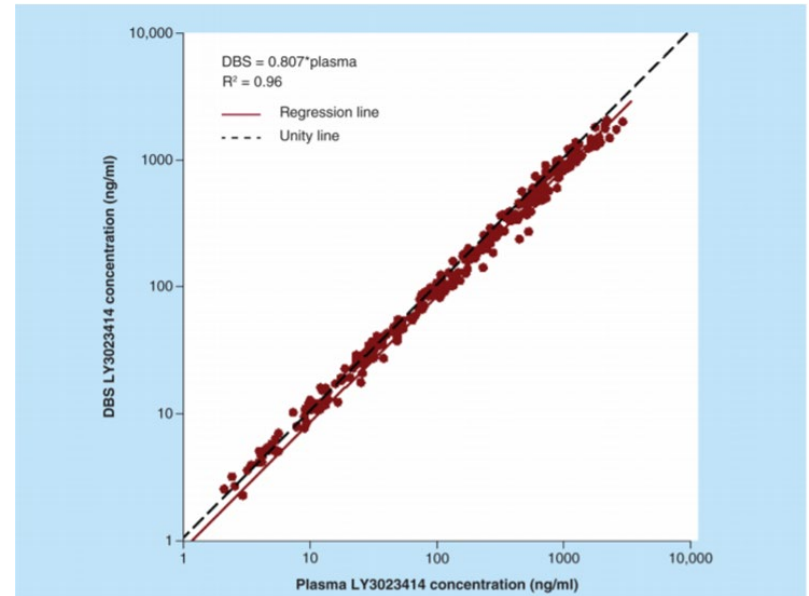

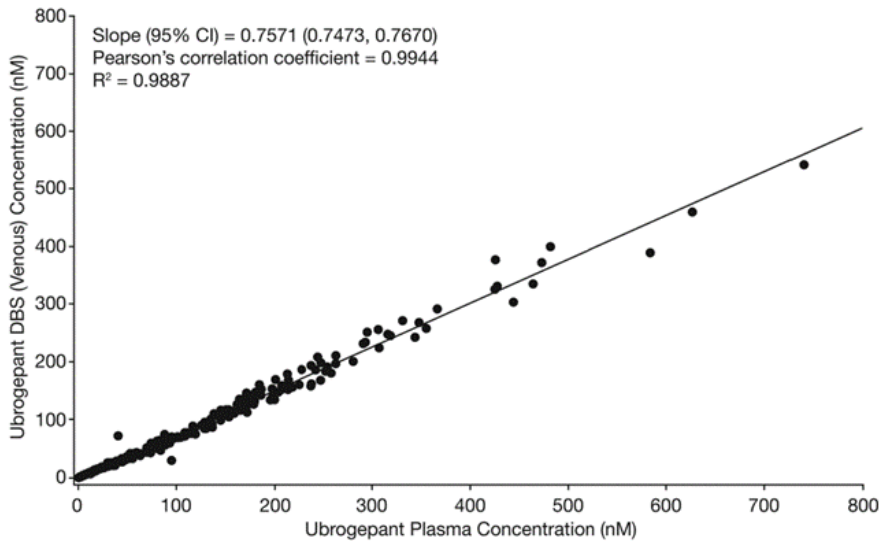

# Is Microsampling data = IV blood/plasma/serum data?

Typically, the biological matrix is either liquid plasma (SM) or serum (LBA)

- Microsampling introduces additional matrices
  - Plasma collected in capillaries
  - Liquid blood
  - Blood diluted in water
  - Dried blood (DBS, VAMS, etc.)
  - Dried plasma
  - Other dried matrices: urine, CSF, etc.
- Also provides alternative sampling sites (compared to IV draw)
  - Finger stick
  - Sub-cutaneous (Tasso, TAP etc)
  - Arterial blood: via umbilical catheter in neonates

## Establish concordance (cross validation) with traditional method (plasma/serum)

- 2018 FDA BMV provides guidance on demonstrating correlation between the microsampling method and traditional method
  - **Wet vs Dry**
  - **Plasma vs Blood**
  - **Venous blood/plasma vs finger stick blood/plasma**
- Use incurred samples ( $n \geq 20$ )?
- Blood from Healthy volunteers? Patients?
- Acceptance criteria?
- Seek feedback from Regulatory agency (FDA).

Li, Bateman, Kothare, et al, 2018. *J Clin Pharmacol*, Vol. 58, No. 3, 294-303

Wickremsinhe et al., *Bioanalysis* (2018) 10(5), 341–356

# How do you decide: to microsample or not!

It's not a panacea: Just another tool in the BioA tool box.

**Make sure it's the right one for the right study**

Needs input from the following:

- Medical
- Clinical operations
- PK
- ADME/DMPK
- BioAnalytical

Clinical & Pharmaceutical Solutions through Analysis

# Clinical Operations

## How to implement patient centric sampling in clinical trials

**What is the need?**

**What question are we answering?**

**Can micro sampling meet this need?**

- Program/Institutional Needs
  - Matrix requirements
  - At home sampling benefits
  - Specific indications – pediatrics, migraine, cancer, therapeutic drug monitoring

***The technology is disruptive to existing workflows across the organization – the need must be great***

## Logistical

- Training Clinical site and Patient – this can involve several clinical sites all over the world and require language translation.
- Sample Integrity/Quality – how do we ensure the right person gets sampled at the right time in the correct way?
- Environmental Exposure in the wild
- Technology access for use in remote/underserved geographies if using an eDiary/App based data collection approach is used.
- Supply – scaling up manufacturing for device availability, lot-to-lot variability.
  - How do you track various lots across large clinical studies, make standards and QCs with matching lots, etc.?
- Shipping requirements within a country and country to country?

## Logistical

- How do we reliably collect a time stamp and how will the data flow?
  - No preassigned barcodes for sample collection, new process needs to be developed and proven to work.
  - How do you match the concentration values with the date and time of collection?
  - What about time zones?
- Patient population may not be appropriate for use of invasive technologies (i.e. shipping HIV infected blood).
- Patient compliance and sample collection reliability, at home sampling needs to be as simple and straightforward as possible.

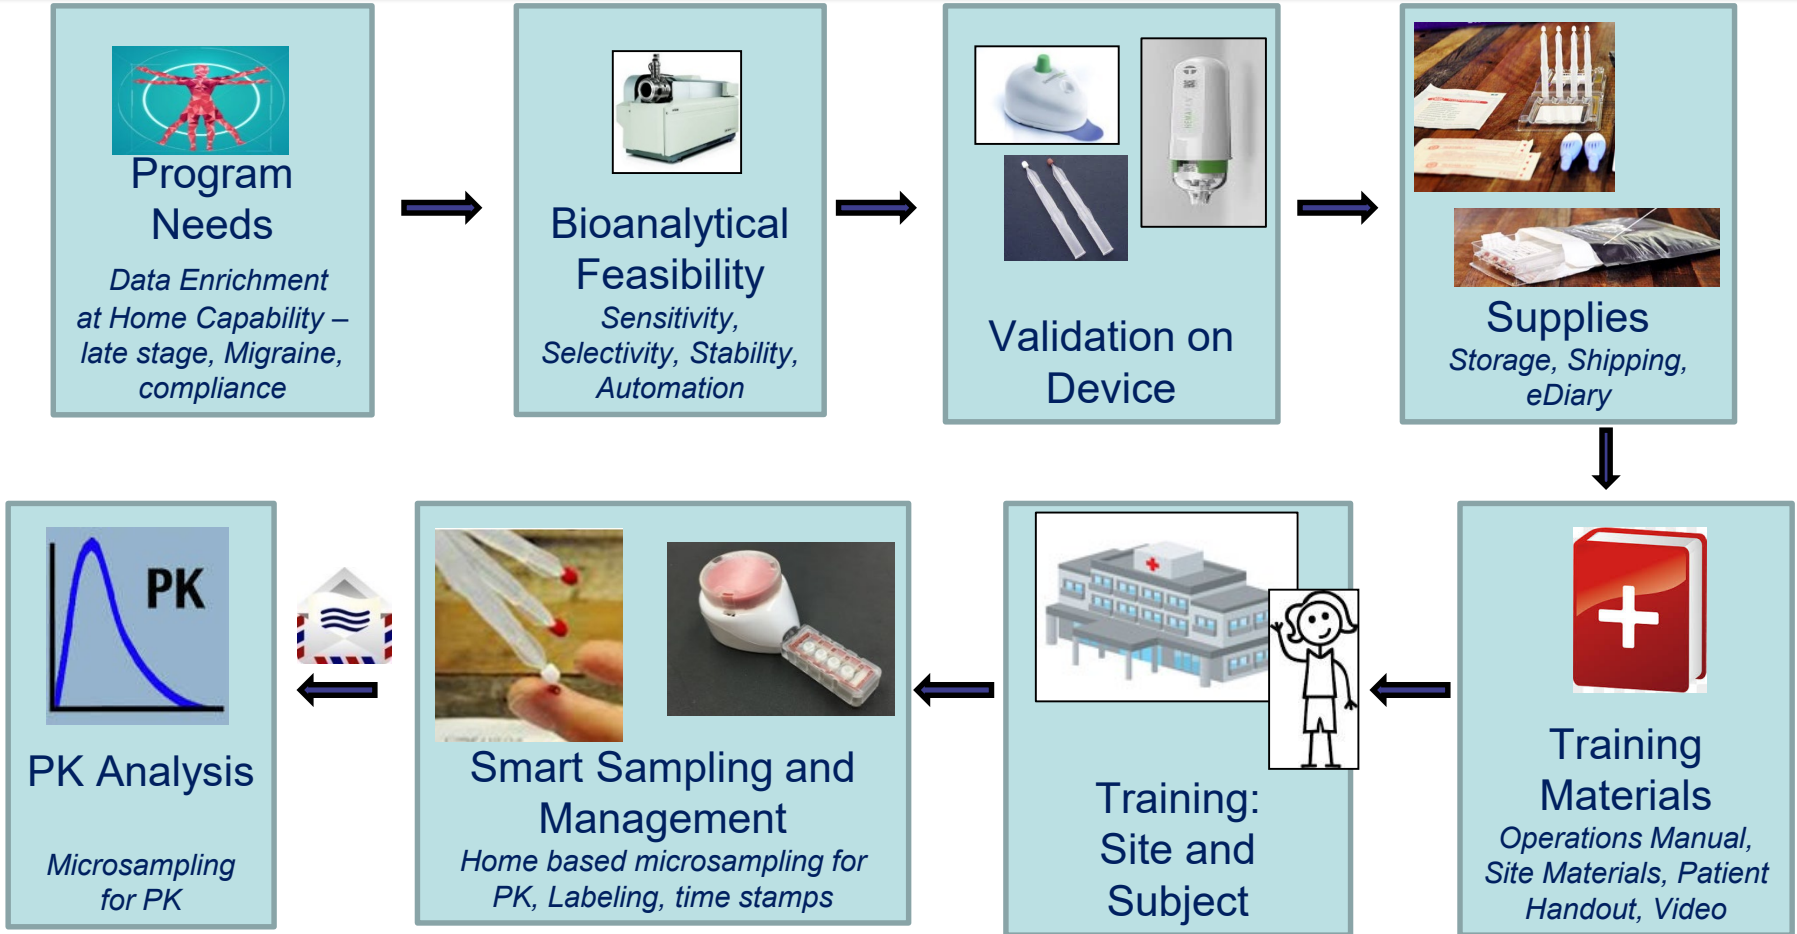

- Records time and temperature every 10 min for 2 weeks
- Starts when button is pressed
- Wireless communication with smartphone or smartbox (to be design in partnership with Merck)

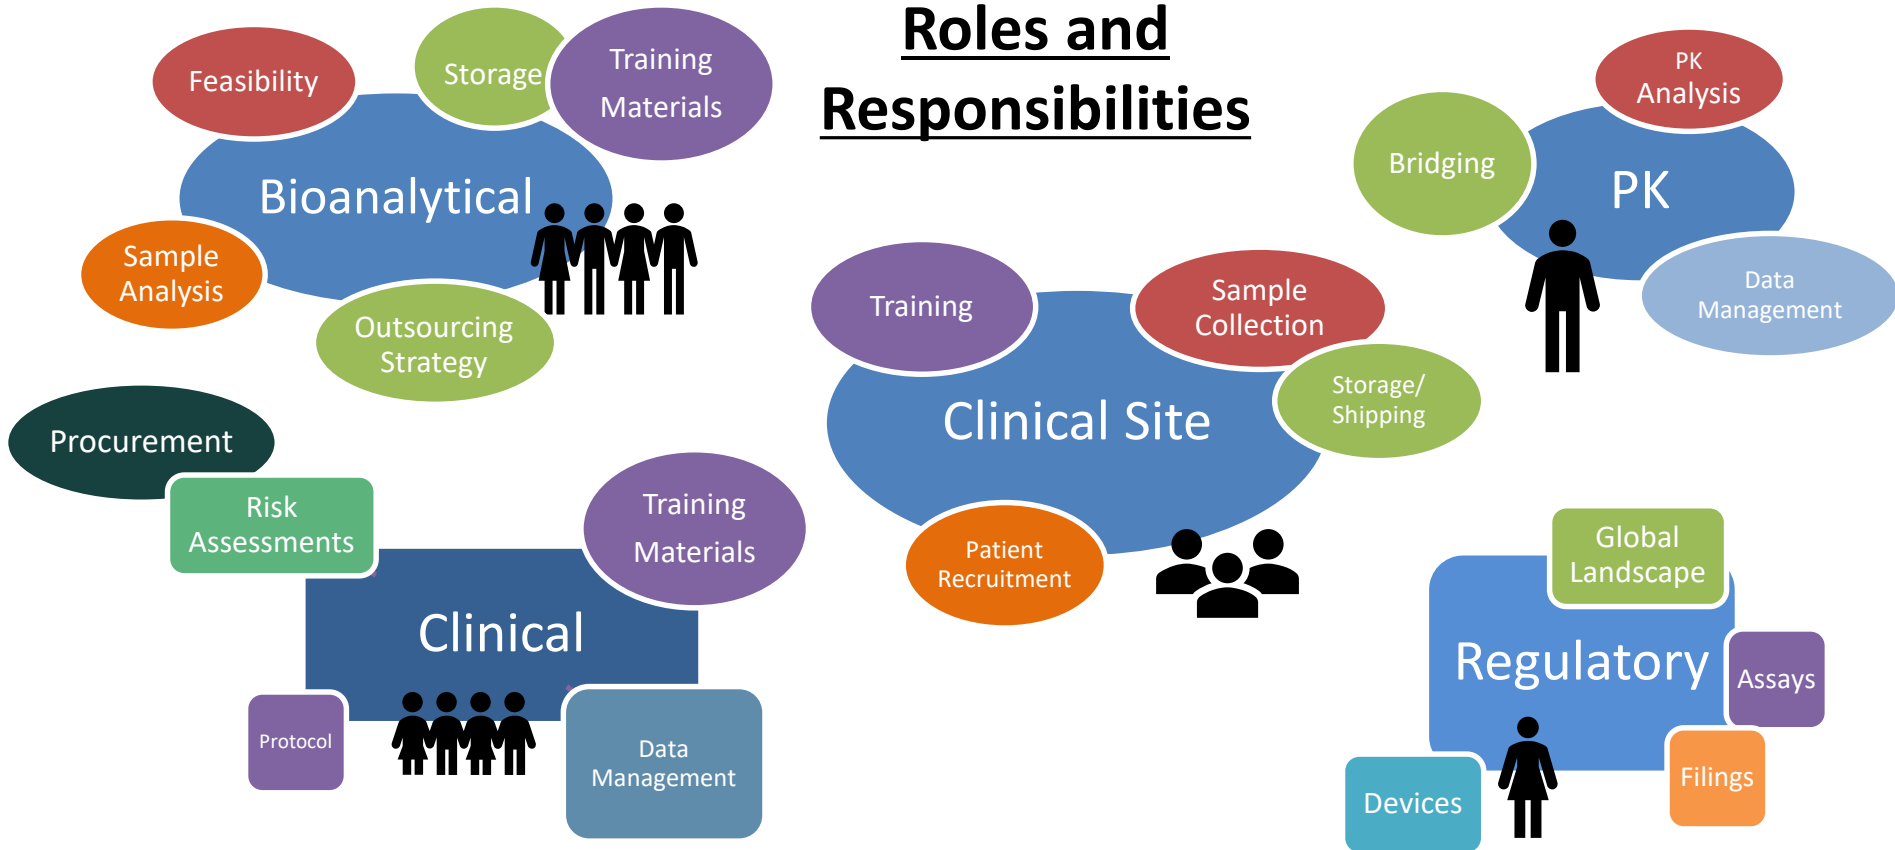

## Business/Regulatory Related

- “If it can’t be used at 100% of sites, it can’t be used at all” attitude.
- Increases the cost of conducting the trial.
- Requires bridging from liquid plasma to dried blood.
- Increases the complexity of the protocol for the trial and this will impact enrollment.
- No definitive data that shows return on investment for Patient-Centric Sampling.
- How are devices treated and what regulatory approval is needed in each country?
- How do we engage with regulators to minimize issues during filing?
- How do you show the sample is from the person enrolled in the trial?
- Can you define inclusion/exclusion criteria using adherence data from at home sampling? What about intent to treat criteria?
  - Potential for un-blinding when using these approaches

## Roles and Responsibilities

# Supplies/Kits

Patient Supply Kit

User guide

Alcohol wipe

Lancet

Sterile gauze pad

Band-Aid®

VAMS tip clamshell

Foil Envelope

Desiccant

Mailing Envelope

## User guide

Step 3: Scan the bar code of the dried blood spot sample collection card on the e-diary (DBS Guide Step 7).

Step 4: Record the date and time of blood sample collection in the corresponding fields of the e-diary

Step 5: Set the card to dry (DBS Guide Step 8)

Step 6: Store the dried blood spot card (DBS Guide Step 9)

Step 7: One (1) hour after you take your drug – collect your blood sample when reminder alarm goes off (DBS Guide Step 1-9)

Step 8: Two (2) hours after you take your drug – collect your blood sample when reminder alarm goes off (DBS Guide Step 1-9)

Step 9: Four (4) hours after you take your drug – collect your blood sample when reminder alarm goes off (DBS Guide Step 1-9)

**Day 12: At Home**

What you need to do today:

- Charge iPhone and iPad and check patch status
- Refer to the CleverCap User Guide on how to remove your study drug from the bottle

Step 1: Take your study drug between 6:00 am and 10:00 am as directed by the study team

Step 2: Turn on the iPad, open the Proteus application.

Step 3: Wait for the skin patch to synchronize the date and time you took the study drug

**Day 13: At Home**

What you need to do today:

- Charge iPhone and iPad and check patch status
- Refer to the CleverCap User Guide on how to remove your study drug from the bottle

Step 1: Take your study drug between 6:00 am and 10:00 am as directed by the study team.

Step 2: Turn on the iPad, open the Proteus application.

Step 3: Wait for the skin patch to synchronize the date and time you took the study drug

**Day 14, At Clinic:**

What you need to do today:

- The study staff will take extra blood samples from you today.
- The clinic site staff will collect samples of blood from your arm at the same time you collect blood for the dried blood spot cards
- Charge iPhone and iPad and check patch status
- Follow the Instructions for Self-Collected Fingertick Dried Blood Spot Samples
- Refer to CleverCap User Guide on how to remove your study drug from the bottle

Step 1: Before taking your study drug, collect the blood sample on a dried blood spot sample collection card (DBS Guide Steps 1-4)

Step 2: Take your study drug between 6:00 am and 10:00 am as directed by the study staff

Step 3: Scan the bar code of the dried blood spot sample collection card on the e-diary (DBS Guide Step 7)

Step 4: Record the date and time of blood sample collection in the corresponding fields of the e-diary

Step 5: Set the card to dry (DBS Guide Step 8)

Step 6: Store the dried blood spot card (DBS Guide Step 9)

Step 7: One (1) hour after you take your drug – collect your blood sample when reminder alarm goes off (DBS Guide Step 1-9)

Step 8: Two (2) hours after you take your drug – collect your blood sample when reminder alarm goes off (DBS Guide Step 1-9)

Step 9: Four (4) hours after you take your drug – collect your blood sample when reminder alarm goes off (DBS Guide Step 1-9)

**Don't forget to bring all devices and envelopes containing the Dried Blood Spot Cards**

Checklist:

- iPad and patch (still wearing on your skin)
- iPhone (e-diary)
- CleverCap pill bottle and 2net Hub
- All envelopes containing DBS cards (Day 5, 8, and 11)

The clinic site staff will provide instructions for the second part of the MK-0421-041 study

## Collection Kits

Our kits contain all that is needed to collect micro samples of blood

Lancet

Alcohol wipe

VAMS Tip Clamshell

Foil Envelope and Desiccant

Band-Aid®

Sterile gauze pad

Mailing Envelope

# Training Materials

- Brochures for Patients
- Brochures for Clinical Staff
- Study Operations Manual
- Videos
- Investigator Meeting Presentations

6.2. Remove device from sterile pouch by pulling the two layers apart to open.

6.3. Ensure that the device is intact (the transparent protective cover of the Tasso device and the adhesive backing are in place).

6.4. Reveal the application site – this is located on the upper arm, 3 finger width-distance from the top of the shoulder, as shown in the diagram below:

6.5. Swab application site with provided ethanol swab. Allow site to air dry.

6.6. Prepare the Tasso device by removing the adhesive backing.

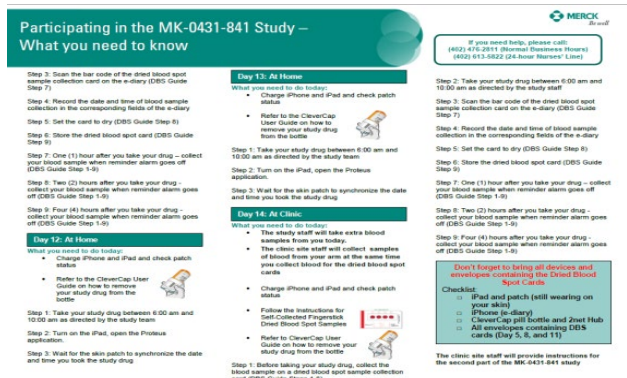

6.7. Place the Tasso device on the swabbed application site with the collection pod pointed down.

6.8. Remove the transparent Tasso device protective cover, revealing the activation button.

6.9. Press firmly and evenly with your thumb on the center of the Tasso button until you hear an audible click. Release your thumb and start the timer.

**Participating in the MK-0431-841 Study – What you need to know**

**Day 12: At Home**

What you need to do today:

- Charge iPhone and iPad and check patch status
- Refer to the CleveCap User Guide on how to remove your study drug from the bottle

Step 1: Take your study drug between 6:00 am and 10:00 am as directed by the study team

Step 2: Turn on the iPad, open the Proteus application

Step 3: Wait for the skin patch to synchronize the date and time you took the study drug

**Day 14: At Clinic**

What you need to do today:

- The study staff will take extra blood samples from you today.
- The clinic site staff will collect samples of blood from your arm at the same time you collect blood for the dried blood spot cards
- Charge iPhone and iPad and check patch status
- Follow the instructions for Self-Collected Fingertick Dried Blood Spot Samples
- Refer to CleveCap User Guide on how to remove your study drug from the bottle

Step 1: Before taking your study drug, collect the blood sample on a dried blood spot sample collection card (DBS Guide Steps 1-6)

**Don't forget to bring all devices and envelopes containing the Dried Blood Spot Cards**

**Checklist:**

- iPad and patch (with swab on your skin)
- iPhone (e-diary)
- CleveCap pill bottle and Zinet Hub
- All envelopes containing DBS cards (Day 5, 8, and 11)

The clinic site staff will provide instructions for the second part of the MK-0431-841 study

# Future Directions

Kevin Bateman & Neil Spooner

What do we  
need to do in  
order to  
progress?

- Technology
  - Sampler features
    - Ease of use – end user vs analytical scientist
    - Sample volume
    - Sample format
      - Wet, dry, plasma, serum, blood
      - Single vs replicates
    - Sample processing at point of collection
    - Time, date & location
    - Traceability
    - Recycle / re-use
  - Analytical workflows
    - Centralised vs decentralised
    - Skilled analysts vs push button
    - Compatibility / integration with analytical methods
  - Standardisation

What do we  
need to do in  
order to  
progress?

- Implementation
  - Organisational change
    - Within group
    - Between groups
  - Regulatory acceptance
  - Acceptance by society
  - Training
    - Patients
    - Clinicians
    - Analytical Scientists

Where else  
can we use  
these  
approaches?

- Large molecule bioanalysis
  - LBA and/or LC-MS approaches
- Vaccine research
  - Epidemiological studies
  - Track response/protection over time
- Non-drug analytes
  - Dynamics of disease signatures (RNA)
  - Longitudinal studies of human health

Clinical & Pharmaceutical Solutions through Analysis  
October 28-31, 2019  
Langhorne, PA

22nd Annual Symposium  
Clinical & Pharmaceutical Solutions through Analysis

# Wrap-up and Next Steps

*Monday 28<sup>th</sup> October 2019, 12:00-16:00 University Grille*
